A computer master sat in front of the computer and tapped a few keyboards, and everything on the website was hacked or tampered with. This is the lens that we often see in movies, it looks very dazzling. In addition, the recent intrusion incidents often occur, which causes the word "hacker" to be passed down by everyone. But what is hacker? They are like "message thieves" who get information from others through the Internet. They act secretly and do not easily reveal their social identity to others.

In recent news, the British and American security units pointed out that the Russian hacker group “Turla” not only misappropriated the Iranian hacker group “OilRig” system, but even controlled their servers. Turla used OilRig's system to conduct cyber-attacks on more than 20 countries in the past 18 months, and these actions took place under the eyes of OilRig and OilRig did not know that they had been hacked. It’s like a typical to murder with a borrowed knife, and OilRig is also very confused about the incident. The system compromised by Turla contains government, military, technology, etc., and Turla aims to steal information from these organizations. This reminds us of the reasons why Turla steals government and military materials. For other organizations, we can associate with selling materials to make a profit. But stealing government and military information cannot be understood. Are they Hacktivism? Hacktivism is use of hacking to promote a political cause. But this brings us to a question, their purpose is to promote politics or simply destroy. Because the group of Turla is more active in the Middle East, we will associate him with political associations. Although their true purpose is not clear, many countries or governments will not allow them to continue their actions.

In conclusion, the hacker is not fixed, and each of us may become a hacker, they may even live around you. But they all hide their identity; it’s hard for us to know
who the hacker is. We sometimes feel that hackers are very annoying because they interfere with our lives just for fun. We can't evaluate the behavior of hackers with our normal eyes, just as we don't understand Turla's behaviors. Also because we don’t understand their behaviors, we can’t clearly know what their purpose is.
