Taking a scientific approach to teaching

Carl Wieman
Stanford University
Department of Physics and Grad School of Education

*based on the research of many people, some from my science ed research group
I. Introduction– Educational goal (*better decisions*) & research-based principles of learning

II. Applying learning principles in university courses and measuring results

III. Brief comments on future steps.
   • Widespread change in university teaching (*better way to evaluate!*)
   • Specific ideas you can use tomorrow.
My background in education

Students: 17 yrs of success in classes. Come into my lab clueless about physics?

2-4 years later ⇒ expert physicists!

??????? ~ 30 years ago

Research on how people learn, particularly physics

- explained puzzle
- I realized were more effective ways to teach
- got me started doing science ed research--controlled experiments & data, basic principles! (~100 papers)
What were my grad students failing to learn?
“thinking like physicists” = how make decisions

Goal of university education:
Students learn to make better decisions

At course and program level: In relevant contexts, use the knowledge and reasoning of discipline to make good decisions with limited information ("expertise")

Rest of talk– how to teach and measure

30 sec – think of decisions “experts” (you) in your discipline make in scholarly work.
• what evidence/information suitable;
• structure of good argument;
• ....
Major advances past 1-2 decades
⇒ New insights on how to learn & teach complex thinking

University science & eng. classroom studies

brain research

physicists, bio, chemists

today

cognitive psychology

Strong arguments for why apply to most fields
Basic result—rethink how learning happens

old/current model

knowledge

soaks in, varies with brain

new research-based view

brain changeable

~ same

transformation

Primary educational focus of universities:

• contents of knowledge “soup”
• admitting best brains
• blaming K-12 for deficiencies

Changes in response to intense thinking. Improved capabilities. Very dependent on teaching methods.
Strenuous extended mental effort—biological requirement. Forms new connections, new neurons.

Builds and strengthens decision-making neural connections. Expertise lies in rewired brain.

For Prof level expertise, requires 1000’s of hours.

fMRI-- interpreting x-ray image
Best way to learn to make good decisions?

a. Being told what the decision should be, if you ever encounter a similar situation (and realize it).

b. Practice making decision, then get specific feedback on how to improve. Repeat...
I. Introduction– Educational goal (*better decisions*) & research-based principles of learning

II. Applying learning principles in university courses and measuring results

III. Brief comments on future steps.
- Widespread change in university teaching (*better way to evaluate*)!
- Specific ideas you can use tomorrow.
II. Teaching to think like an expert, what research says is important

- Disciplinary expertise
- Prior knowledge & experience
- Motivation
- Brain constraints

---

Learning
practicing desired thinking with good feedback

---

Implementation
Tasks/questions + deliverables
Social learning

---

Defines “teaching expertise” – practices that research shows produce more learning
Learning
practicing desired thinking, with good feedback

How enter into design of practice activities (in class, then homework...)?
Learning expert thinking*--

- Challenging tasks/questions *prior know.*
- Practicing desired thinking skills *expertise*

**Decisions when solving sci & eng problem**

- **Decide:** what concepts/models relevant
- **Decide:** What information relevant, irrelevant, needed.
- **Decide:** what approximations are appropriate.
- " potential solution method(s) to pursue.
- ....
- " if solution/conclusion make sense- criteria for tests.

*Learner must practice making decisions.*

*Large difference between making decision (good or not) vs. being told outcome to use.* *(Holmes, Keep, Wieman, TBP)*

* “Deliberate Practice”, A. Ericsson research. See “Peak;...” by Ericsson for accurate, readable summary
Does this apply to non-STEM disciplines?

Yes. Defining feature of a discipline is a set of agreed upon standards for making relevant decisions with limited information. *(i.e. what makes a good scholar)* *(Wieman, Daedalus, May 2019)*

**How decide on:**
What is worthwhile scholarly work?
What is valid information?
What is suitable argument from information to conclusions?
What is appropriate form of presentation of work?
.....
Learning through practice with feedback

How these need to enter into design of practice activities (in class, then homework...)?
Expert thinking to practice-- activity design*

*Brain constraints:*

1) working memory has limit 5-7 new items. Additional items reduce processing & learning.
   - Split attention (checking email, ...)—learning disaster
   - Jargon, nice picture, interesting little digression or joke actually hurts.

2) long term memory— **biggest problem is recall after learning additional stuff**--interference.
   Interference suppressed by repeated interleaved recall
Learning through practice with feedback

Student variation
- Disciplinary expertise
- Prior knowledge & experience
- Motivation
- Brain constraints

Implementation
- Tasks/questions + deliverables
- Social learning
Implementation—

1. Design good tasks (as above) but with **deliverables** (define task & instructor use to guide feedback)

2. **Social learning** (working in groups, in class 3-4)
   Talking to fellow students better than hearing expert instructor explain??
   - More targeted feedback & avoids getting stuck, so more efficient
   - People teaching/explaining to others triggers unique cognitive process ⇒ learning
   - **Very useful as a teacher** to listen in on student conversations!
     ⇒ *timely, specific, actionable feedback*
Teaching about electric current & voltage

1. Preclass assignment--Read pages on electric current. Learn basic facts and terminology without wasting class time. Short online quiz to check/reward.

2. Class starts with question:

How to apply in classroom? 

practicing thinking with good feedback

Example– large intro physics class 
(similar chem, bio, comp sci, ...)

When switch is closed, bulb 2 will
a. stay same brightness,
b. get brighter
c. get dimmer,
d. go out.

3. Individual answer with clicker

4. Discuss with “consensus group”, revote.

Instructor listening in! What aspects of student thinking like physicist, what not?
5. Demonstrate/show result

6. Instructor follow up summary—feedback on which models & which reasoning was correct, & **which incorrect and why**. Many student questions.

**Students practicing thinking like physicists**—(deciding on applying, testing conceptual models, critiquing reasoning...)

**Feedback that improves thinking**—other students, informed instructor, demo
III. Evidence from the Classroom

~ 1000 research studies from undergrad science and engineering comparing traditional lecture with “active learning” (or “research-based teaching”).

• consistently show greater learning
• lower failure & dropout rates

Massive meta-analysis all sciences & eng. similar. PNAS Freeman, et. al. 2014

A few examples—
various class sizes and subjects
Apply concepts of force & motion like physicist to make predictions in real-world context?

average trad. Cal Poly instruction

1st year mechanics

9 instructors, 8 terms, 40 students/section. Same instructors, better methods = more learning!

Cal Poly, Hoellwarth and Moelter, Am. J. Physics May ‘11
U. Cal. San Diego, Computer Science
Failure & drop rates—Beth Simon et al., 2012

Standard Instruction

<table>
<thead>
<tr>

same 4 instructors, better methods = 1/3 fail rate
Enhancing Diversity in Undergraduate Science: Self-Efficacy Drives Performance Gains with Active Learning, CBE-LSE. 16
Cissy Ballen, C. Wieman, Shima Salehi, J. Searle, and K. Zamudio

Large intro bio course at Cornell
- trad lecture

(Yr 1 trad course grade)

(Prev yr prep correction)

(Non-URM vs. URM)

(small correction for incoming prep)
Large intro bio course at Cornell

- yr1-trad lecture,
- yr2- full active learning

**URM gap disappears**
Learning in the in classroom*

Comparing the learning in two ~identical sections
UBC 1st year college physics. 270 students each.

Control--standard lecture class– highly experienced Prof with good student ratings.

Experiment-- new physics Ph. D. trained in principles & methods of research-based teaching.

They agreed on:
• Same material to cover (Can’t cover as much?)
• Same class time (3 hours, 1 week)
• Same exam (jointly prepared)- start of next class

*Deslauriers, Schelew, Wieman, Sci. Mag. May 13, ’11
Clear improvement for entire student population. Engagement 85% vs 45%.
Advanced courses
U. Col, UBC, & Stanford 2\textsuperscript{nd} - 4\textsuperscript{th} year physics

Design and implementation: Jones, Madison, Wieman, Transforming a fourth year modern optics course using a deliberate practice framework, 

Worksheets
Final Exam Scores
nearly identical problems

1 standard deviation improvement

practice & feedback, 1st instructor
practice & feedback 2nd instructor

taught by lecture, 1st instructor, 3rd time teaching course
& instructors all greatly prefer to lecturing

Transforming teaching of Stanford physics majors

8 physics courses 2\textsuperscript{nd}-4\textsuperscript{th} year, seven faculty, ‘15-’17

- Attendance up from 50-60\% to ~95\% for all.
- Student anonymous comments:

  90\% positive, only 4\% negative
  (mostly VERY positive, “All physics courses should be taught this way!”)

- All the faculty greatly preferred to lecturing.

Typical response across ~ 250 faculty at UBC & U. Col. Teaching much more rewarding.
“But traditional lectures can’t be as bad as you claim. Look at us university professors who were taught by traditional lectures.”

Bloodletting was the medical treatment of choice for ~2000 years, based on exactly the same logic.

Need proper comparison group. (science) If better teaching, would have been more successful, along with many other students.
I. Introduction—Educational goal (*better decisions*) & research-based principles of learning

II. Applying learning principles in university courses and measuring results

III. Brief comments on future steps.
- Widespread change in university teaching (*better way to evaluate!*)
- Specific ideas you can use tomorrow.
What universities and departments can do. Experiment on large scale change of teaching.

Changed teaching of ~250 science instructors & 200,000 credit hrs/yr UBC & U. Colorado

**Important results:**
1. Large scale change is possible. (Entire departments)
2. When faculty learn how to teach this way (~50 hrs) they prefer to lecturing. Costs the same.
3. Need to recognize, support, and incentivize teaching expertise.
4. Need better way to evaluate teaching-
Necessary 1st step-- better evaluation of teaching

“A better way to evaluate undergraduate science teaching”
Change Magazine, Jan-Feb. 2015, Carl Wieman

Requirements:
1) measures what leads to most learning
2) equally valid/fair for use in all courses
3) actionable-- how to improve, & measures when do
4) is practical to use routinely
   student course evaluations do only #4

Better way–characterize the practices used in teaching a course, extent of use of research-based methods. 5-10 min/course
“Teaching Practices Inventory”
http://www.cwsei.ubc.ca/resources/TeachingPracticesInventory.htm
Applications of research instructors can use immediately *(some very common but bad practices)*

1. Organization of how a topic is presented
2. Design of homework and exam problems
3. Feedback to students
4. Review lectures *(why often worse than useless)*

*(see cwsei research papers & instructor guidance)*
1. Organization of how topic is presented.

**Very** standard teaching approach: Give formalism, definitions, equa’s, and then move on to apply to solve problems.

*What could possibly be wrong with this? Nothing, *if* learner has an expert brain.*
Expert organizes this knowledge as tools to use, along with criteria for when & how to use.

- Student does not have this system for organizing knowledge. Can only learn as disconnected facts, not linked to problem solving. Not recall when need.
- Much higher demands on working memory = less capacity for processing.
- Unmotivating—see no value.
A better way to present material—
“Here is a meaningful problem we want to solve.”
“Try to solve” (and in process notice key features of context & concepts—basic organizational structure).

Now that they are prepared to learn--“Here are tools (formalism and procedures) to help you solve.”

More motivating, better mental organization & links, less cognitive demand = more learning.

“A time for telling” Schwartz & Bransford (UW), Cog. and Inst. (1998), Telling after preparation ⇒ x10 learning of telling before, and better transfer to new problems.
Conclusion:
Research providing new insights & data on effective teaching and learning of university science. Better way to teach. Better way to evaluate teaching.

Potential to dramatically improve education. Still using teaching equivalent to blood letting.

Good References:
- S. Ambrose et. al. “How Learning works”
- D. Schwartz et. al. “The ABCs of how we learn”
- Ericsson & Pool, “Peak:…”
- Wieman, “Improving How Universities Teach Science”
- cwsei.ubc.ca-- resources (implementing best teaching methods), references, effective clicker use booklet and videos
~ 30 extras below
Structure of active learning class

*Good for any subject, level, class size*

**Actions**

- **Preparation**
  - Complete targeted reading
  - Formulate/review activities

- **Introduction (2-3 min)**
  - Listen/ask questions on reading
  - Introduce goals of the day

- **Activity (10-15 min)**
  - Group work on activities
  - Circulate, answer questions & assess students

- **Feedback (5-10 min)**
  - Listen/ask questions, provide solutions & reasoning when called on
  - Facilitate class discussion, provide feedback to class

**Two essential features:**

- students are thinking—practicing expert reasoning
- instructor more knowledgeable about that thinking—more effective teaching & feedback
How it is possible to cover as much material? (if worrying about covering material not developing students expert thinking skills, focusing on wrong thing, but...)

• transfers information gathering outside of class,
• avoids wasting time covering material that students already know

Advanced courses-- often cover more

Intro courses, can cover the same amount. But typically cut back by ~20%, as faculty understand better what is reasonable to learn.
3. Feedback to students

Standard feedback—“You did this problem wrong, here is correct solution.”

Why bad? Research on feedback—simple right-wrong with correct answer very limited benefit.

Learning happens when feedback:
• timely and specific on what thinking was incorrect and why
• how to improve
• learner acts on feedback.

Building good feedback into instruction among most impactful things you can do!
Components of expert thinking:
- recognizing relevant & irrelevant information
- select and justify simplifying assumptions
- concepts and models + selection criteria
- moving between specialized representations (graphs, equations, physical motions, etc.)
- Testing & justifying if answer/conclusion reasonable

1. Designing homework & exam problems (& how to improve)
What expertise being practiced and assessed?
- Provide all information needed, and only that information, to solve the problem
- Say what to neglect
- Possible to solve quickly and easily by plugging into equation/procedure from that week
- Only call for use of one representation
- Not ask why answer reasonable, or justify decisions

How to improve? Don’t do the bad stuff.
Most university instructors and administrators don’t know about, but growing recognition of research:

- US National Acad. of Sciences (2012)
- PCAST Report to President (2012)

*Calling on universities to adopt*

**Amer. Assoc. of Universities** (60 top N. Amer. Univ.’s—Stanford, Harvard, Yale, MIT, U. Cal, …)

Pre 2011-- “*Teaching? We do that?*”

**2017 Statement by President of AAU**--

“*We cannot condone poor teaching of introductory STEM courses ... simply because a professor, department and/or institution fails to recognize and accept that there are, in fact, more effective ways to teach. Failing to implement evidence-based teaching practices in the classroom must be viewed as irresponsible, an abrogation of fulfilling our collective mission ....*”
Situation with university science teaching now much like medicine in 19th century.

Methods used and believed in for hundreds of years

But science—controlled comparisons, data, and scientific principles, provided new methods. Much more effective. (but takes a while for doctors to learn & use)
“A time for telling” Schwartz and Bransford, Cognition and Instruction (1998)

People learn from telling, **but only** if well-prepared to learn. Activities that develop knowledge organization structure.

Students analyzed contrasting cases ⇒ recognize key features

<table>

</tr>
</tbody>
</table>
Pre-class Reading

Purpose: Prepare students for in-class activities; move learning of less complex material out of classroom
Spend class time on more challenging material, with Prof giving guidance & feedback

Can get >80% of students to do pre-reading if:
• Online or quick in-class quizzes for marks (tangible reward)
• Must be targeted and specific: students have limited time
• DO NOT repeat material in class!

Learning through practice with feedback

How enter into design of practice activities (in class, then homework...)?
Expert thinking to practice, activity design*

- *(Motivation)* Make subject interesting & relevant to student (choice of context, problem driven).

Belief that can master the material
Some control of learning process.
“Discipline-based education research” (DBER)

Largely in N. America but spreading

Started in physics ~ 50 years ago (myself 30 years) Now in all science & engineering disciplines

Edging into math & social sciences
Motivation-- essential
(complex- depends on background)

Enhancing motivation to learn

a. Relevant/useful/interesting to learner
(meaningful context-- connect to what they know and value)

requires expertise in subject

b. Sense that can master subject and how to master, recognize they are improving/accomplishing

c. Sense of personal control/choice
A better way to evaluate undergraduate science teaching
Change Magazine, Jan-Feb. 2015
Carl Wieman

“The Teaching Practices Inventory: A New Tool for Characterizing College and University Teaching in Mathematics and Science”
Carl Wieman* and Sarah Gilbert
(and now engineering & social sciences)

Try yourself. ~ 10 minutes to complete.
http://www.cwsei.ubc.ca/resources/TeachingPracticesInventory.htm

Provides detailed characterization of how course is taught
Biology  Jargen bogs down working memory, reduces learning?

Concepts first, jargon second improves understanding
L. Macdonnell, M. Baker, C. Wieman, Biochemistry and Molecular biology Education

“Small change, big effect!”

Control  Experiment
preread: textbook  jargon-free
active learning class  common post-test

Control       jargon-free

DNA structure     Genomes
Post-test results

# of students
Emphasis on motivating students
Providing engaging activities and talking in class
Failing half as many
“Student-centered” instruction

Aren’t you just coddling the students?

Like coddling basketball players by having them run up and down court, instead of sitting listening?

Serious learning is inherently hard work
Solving hard problems, justifying answers—much harder, much more effort than just listening.

But also more rewarding (if understand value & what accomplished)—motivation
A few final thoughts—

1. Lots of data for college level, does it apply to K-12?

   There is some data and it matches. Harder to get good data, but cognitive psych says principles are the same.

2. Isn’t this just “hands-on”/experiential/inquiry learning?

   No. Is practicing thinking like scientist with feedback. Hands-on may involve those same cognitive processes, but often does not.
Effective teacher—

- Designing suitable practice tasks
- Providing timely guiding feedback
- Motivating

("cognitive coach")

requires expertise in the content!
A scientific approach to teaching

Improve student learning & faculty enjoyment of teaching

**My ongoing research:**
1. Bringing “invention activities” into courses—students try to solve problems first. *Cannot* but prepares them to learn.

2. Making intro physics labs more effective. (Our studies show they are not. Holmes & Wieman, Amer. J. Physics)

Lesson from these Stanford courses—

**Not hard for typical instructor to switch to active learning and get good results**

- read some references & background material (like research!)
- fine to do incrementally, start with pieces
Reducing demands on working memory in class

- Targeted pre-class reading with short online quiz
- Eliminate non-essential jargon and information
- Explicitly connect
- Make lecture organization explicit.
clickers*--

Not automatically helpful-- give accountability, anonymity, fast response

Used/perceived as expensive attendance and testing device ⇒ little benefit, student resentment.

Used/perceived to enhance engagement, communication, and learning ⇒ transformative

• challenging questions-- concepts
• student-student discussion ("peer instruction") & responses (learning and feedback)
• follow up instructor discussion- timely specific feedback
• minimal but nonzero grade impact

*An instructor's guide to the effective use of personal response systems ("clickers") in teaching-- www.cwsei.ubc.ca
Expert thinking/competence =
• factual knowledge
• Mental organizational framework $\Rightarrow$ retrieval and application

or ?

corcepts & mental models
(& criteria for when apply)

• Ability to monitor own thinking and learning

New ways of thinking—everyone requires MANY hours of intense practice to develop.
Brain changed—rewired, not filled!

*I. Research on expert thinking*
historians, scientists, chess players, doctors,...

*Cambridge Handbook on Expertise and Expert Performance*
Retention curves measured in Bus’s Sch’l course. UBC physics data on factual material, also rapid drop but pedagogy dependent. (in prog.)
Design principles for classroom instruction
1. Move simple information transfer out of class. Save class time for active thinking and feedback.

2. “Cognitive task analysis” -- how does expert think about problems?
3. Class time filled with problems and questions that call for explicit expert thinking, address novice difficulties, challenging but doable, and are motivating.
4. Frequent specific feedback to guide thinking.
Institutionalizing improved research-based teaching practices. *(From bloodletting to antibiotics)*

Goal of Univ. of Brit. Col. CW Science Education Initiative *(CWSEI.ubc.ca)* & Univ. of Col. Sci. Ed. Init.

- Departmental level, widespread sustained change at major research universities
  - Scientific approach to teaching, all undergrad courses
- Departments selected competitively
- Substantial one-time $$$ and guidance

Extensive development of educational materials, assessment tools, data, etc. Available on web.

Visitors program
