SPICE: A Competitive Project Management Paradigm

Robert Maribe Branch, The University of Georgia

EXECUTIVE SUMMARY

SPICE is a project management paradigm based on systems theory. The SPICE paradigm is based on the premise of developing a network of devoted individuals and working partnerships that sustain competitiveness through effective project management. Because technology has expanded the capability to manage projects across greater geographical distances over time, project management paradigms are beginning to reflect the information age where resources and organizations can be situated at remote sites, accessed at convenient times, and personalized to match the needs of a specific project. Models derived from the SPICE paradigm promote practices that are generative, responsive, and validating.
