Ideal ESPRIT Algorithm

- **Do eigendecomposition of \mathbf{R}_y**

$$\mathbf{V}_{s+n} = \begin{bmatrix} \mathbf{v}_1 & \cdots & \mathbf{v}_{N_s} \end{bmatrix} \equiv \begin{bmatrix} \mathbf{E}_0 \\ \mathbf{E}_1 \end{bmatrix}$$

- **Solve $\mathbf{E}_1 = \mathbf{E}_0 \Psi$ for Ψ**

$$\phi_i = \sin^{-1} \left(\arg(\lambda_i^{(\Psi)}) \frac{\lambda}{2\pi\Delta} \right)$$

Total Least Squares for Practical ESPRIT

- **Goal: “Solve” $\hat{\mathbf{E}}_1 = \hat{\mathbf{E}}_0 \Psi$ when both sides have errors**

- **Formulation:**

$$(\hat{\mathbf{E}}_1 + \Delta \mathbf{E}_1) = (\hat{\mathbf{E}}_0 + \Delta \mathbf{E}_0) \Psi$$

- **Find $\hat{\mathbf{E}}_0$, $\hat{\mathbf{E}}_1$, and Ψ that minimizes**

$$\|[\Delta \mathbf{E}_0 \ \Delta \mathbf{E}_1]\|_F^2 \equiv \text{tr}([\Delta \mathbf{E}_0 \ \Delta \mathbf{E}_1][\Delta \mathbf{E}_0 \ \Delta \mathbf{E}_1]^H)$$

The Null Subspace - Ideally

- Ideally $\mathbf{E}_1 = \mathbf{E}_0 \Psi$, so \mathbf{E}_0 and \mathbf{E}_1 share the same subspace

$\rightarrow \begin{bmatrix} \mathbf{E}_0 & \mathbf{E}_1 \end{bmatrix}^{2N_s}$ has rank N_s

$$\rightarrow \exists \mathbf{F} = \begin{bmatrix} \mathbf{F}_0 \\ \mathbf{F}_1 \end{bmatrix}_{2N_s} \quad 0 = \begin{bmatrix} \mathbf{E}_0 & \mathbf{E}_1 \end{bmatrix} \mathbf{F} = \mathbf{E}_0 \mathbf{F}_0 + \mathbf{E}_1 \mathbf{F}_1$$

spans null subspace of $[\mathbf{E}_0 \mathbf{E}_1]$

Copyright 2011 Aaron Lanterman

Exploiting the Null Subspace

- Ideally $\mathbf{E}_1 = \mathbf{E}_0 \Psi$, so \mathbf{E}_0 and \mathbf{E}_1 share the same subspace

$$0 = \mathbf{E}_0 \mathbf{F}_0 + \mathbf{E}_1 \mathbf{F}_1$$

$$\mathbf{E}_1 \mathbf{F}_1 = -\mathbf{E}_0 \mathbf{F}_0$$

$$\mathbf{E}_1 = \mathbf{E}_0 (-\mathbf{F}_0 \mathbf{F}_1^{-1})$$

$$\rightarrow \Psi = -\mathbf{F}_0 \mathbf{F}_1^{-1}$$

The Null Subspace – in Reality

- In reality, won't have $[\hat{\mathbf{E}}_0 \hat{\mathbf{E}}_1] \mathbf{F} = 0$
- It "is easily shown" we should replace it with

$$\hat{\mathbf{E}}_{01} \mathbf{F} = [\Delta \mathbf{E}_0 \Delta \mathbf{E}_1]$$

$$\text{where } \hat{\mathbf{E}}_{01} = [\hat{\mathbf{E}}_0 \hat{\mathbf{E}}_1]$$

- Seek \mathbf{F} that minimizes $\|\hat{\mathbf{E}}_{01} \mathbf{F}\|_F$
s.t. $\mathbf{F}^H \mathbf{F} = \mathbf{I}$

Copyright 2011 Aaron Lanterman

Magic

- "applying standard Lagrange techniques leads to a solution"
- Compute eigenvectors of $\hat{\mathbf{E}}_{01}^H \hat{\mathbf{E}}_{01}$

$$\begin{bmatrix} \mathbf{F}_0 \\ \mathbf{F}_1 \end{bmatrix} = \mathbf{F} = \underbrace{\begin{bmatrix} \tilde{\mathbf{v}}_{N_s+1} & \cdots & \tilde{\mathbf{v}}_{2N_s} \end{bmatrix}}_{N_s \text{ smallest eigenvectors of } \hat{\mathbf{E}}_{01}^H \hat{\mathbf{E}}_{01}}$$

- In general cases, total least squares uses a SVD

Copyright 2011 Aaron Lanterman

Practical ESPRIT Algorithm

- Do eigendecomposition of $\hat{\mathbf{R}}_y$

$$\hat{\mathbf{V}}_{s+n} = [\hat{\mathbf{v}}_1 \ \dots \ \hat{\mathbf{v}}_{N_s}] \equiv \begin{bmatrix} \hat{\mathbf{E}}_0 \\ \hat{\mathbf{E}}_1 \end{bmatrix}$$

- Let $\mathbf{F} = N_s$ smallest eigvecs of

$$[\hat{\mathbf{E}}_0 \ \hat{\mathbf{E}}_1]^H [\hat{\mathbf{E}}_0 \ \hat{\mathbf{E}}_1]$$

$$\Psi = -\mathbf{F}_0 \mathbf{F}_1^{-1} \quad \phi_i = \sin^{-1} \left(\arg(\lambda_i^{(\Psi)}) \frac{\lambda}{2\pi\Delta} \right)$$
