HOW TO GET THE MOST OUT OF RECASTING
A Guide for Speech-Language Pathologists Teaching Morphology and Simple Syntax

RECAST: Repeat child's utterance using the correct production

1 RECAST PER MINUTE

is suggested when using recasting in treatment for morphology and simple syntax.

600-1,000 recasts of correct utterances are needed for children to make improvements.

10 HOURS OF TREATMENT

is the recommended total amount of time needed for a child to show gains in morphology and syntax when using recasting.

COMPARSED TO IMITATION, FEWER RECASTS

were required on average to elicit spontaneous use of targets in a 1998 study of 21 children.
