Has your child previously had COVID-19?

Children ages 7-17 needed for a study assessing the effects of COVID-19 on blood vessel function

A University of Delaware Cardiovascular Research Laboratory is conducting a research study to evaluate blood vessel function in healthy children between the ages of 7 and 17.

Participants will include children who have had a positive COVID-19 diagnosis within the past 3-6 months OR children who have never been diagnosed with COVID-19

Participants will be asked to complete tests including but not limited to: noninvasive blood vessel testing including ultrasound imaging and a blood sample.

This study only requires 1 visit to the STAR Health Sciences Complex at UD and participants will be compensated for their time (~2 hours).
