How are Utah families using their Child Tax Credit payments?

Evidence from Census Data

The temporary expansion of the Child Tax Credit (CTC) is projected to cut American child poverty by more than half. The CTC expansion provides families with $3,600 for every child in the household under the age of six, and $3,000 for every child between the ages of six and 17. The vast majority of U.S. families with children are eligible for the CTC.

In this research brief, we use data from the Census Household Pulse survey to examine how a representative sample of Utah families making less than $150,000 a year report using their CTC payments. This survey was administered between July 21st and August 16th, covering the period in which the first two CTC payments were deposited in families’ bank accounts.

Key Finding 1: 70% of eligible UT families received the CTC.

Key Finding 2: 37% of UT families reported mostly using their CTC to pay down debt, 39% mostly saved their CTC, and 25% mostly spent it.

Key Finding 3: The most common uses of the CTC payments among UT families were purchasing food for their family (45%), contributing to savings or investments (29%), and paying down debt (28%).

Key Finding 4: Food insecurity rates were largely flat among eligible UT families after the CTC payments went out.
**Key Finding 5:** UT families in the middle income category received the CTC at the highest rate (71%), followed by families in the highest income category (69%).

**Key Finding 6:** UT families in the lowest income category were more likely to use their CTC funds to pay down debt relative to other groups, while those in the middle and highest income categories were more likely to report mostly saving their CTC payments.
