There is work left to be done: building an evidence base for personalized digital health tools in maternal health

Abstract: Digital health tools such as patient portals, wearable devices, telehealth, and mHealth present opportunities for better maternal and infant outcomes. These tools have the potential to promote better communication, engagement, and shared decision making between patients and their providers. The current evidence about the benefits of these tools have primarily focused on patients with chronic conditions, and there is a dearth of such studies focused on pregnant individuals. Our research team embarked on several related studies, both quantitative and qualitative, to explore the current use and opportunities with using digital health tools among pregnant individuals. The goal of our symposium is to present the formative findings from our investigation of existing use and perceptions of using such tools among pregnant patients seen at our academic medical center.

About the Speaker: Dr. Fareed is an Assistant Professor of Biomedical Informatics and core faculty at the Center for the Advancement of Team Science, Analytics, and Systems Thinking (CATALYST) at the Ohio State University Wexner Medical Center (OSUWMC). Dr. Singh is a post doctoral fellow at CATALYST.
