## Mission

CONSIRT Working Papers are high quality, cross-national, comparative, English language scholarly work that communicates new ideas and has clear contributions to the social sciences. We encourage empirical and methodological papers with deep theoretical roots. Interdisciplinary work in this regard is also encouraged. Our mission is to promote these works in an open, electronic forum for the benefit of the international social science community.

## What CONSIRT Working Papers Are

Papers in the CONSIRT Working Papers Series are pre-publication versions of the author(s)' academic work. Working Papers posted on [consirt.osu.edu](http://consirt.osu.edu) are in progress, under submission, or forthcoming. Working Papers are produced on this site by the author(s) for the consumption of the international scientific community and others interested in this work. CONSIRT Working Papers are not subject to double-blind peer review. CONSIRT reviewed the Working Paper submission for general suitability, including criteria for professional scholarly work, but the quality of the Working Paper itself is the responsibility of the author(s). The form and content of papers are the responsibility of individual authors. The cover sheet is standard across all papers (subject to change), but the format of the rest of the work is not standardized. Comments on papers or questions about their content should be sent directly to the author(s), at their email address.

## Citation of CONSIRT Working Papers

Working Papers may be cited without seeking prior permission from the author(s). The proper form for citing CONSIRT Working Papers is:

Author(s). Year. "Title." CONSIRT Working Papers Series [number in the series] at [consirt.osu.edu](http://consirt.osu.edu).

Once a CONSIRT Working Paper has been published elsewhere, it is customary that it be cited in its final, published version, rather than in its Working Paper version.

## Copyright Statement

Copyright to CONSIRT Working Papers remains with the author(s). Posting a Working Paper on [consirt.osu.edu](http://consirt.osu.edu) does not preclude simultaneous or subsequent publication elsewhere, including other working papers series. It is the current policy of CONSIRT to maintain all Working Papers posted on the CONSIRT website unless otherwise notified by the author(s). Users of this website may consume papers for their own personal use, but downloading of papers for any other activity, including but not limited to electronic reposting to the internet in any way, may only be done with the written consent of the author(s). It is the author(s)'s responsibility to know if copyright has been transferred upon publication elsewhere and to ask CONSIRT to have it removed from the site, if necessary.

# The Large Number of Duplicate Records in International Survey Projects: The Need for Data Quality Control

**Abstract:** We report a curious and unexplained fact about responses in a large set of social science survey projects. A probabilistic model shows that the occurrence of identical answers to all questionnaire items in an average sample is exceedingly small, which compels us to treat duplicate records as erroneous or at least suspicious. We analyzed the set of 1,721 national surveys in 22 projects from 142 countries covering 2.3 million respondents. We found a surprisingly large number (5,893) of duplicate records in 162 national surveys from 17 projects, covering 80 countries. Although the number of duplicate records is a small fraction of all records, they diminish the data quality and potentially have undesirable effects on the results of statistical analyses. We demonstrate that identifying these records allows researchers to examine the consequences of their existence in the data files. We argue that such erroneous or suspicious records should be flagged in all publically available data archives.

## Introduction

Comparative social sciences rely, to a great extent, on data from international survey projects, usually covering at least a few countries. Survey methodology specialists in comparative studies produce a large and increasing number of publications on data quality (1). However, one aspect of data quality has been largely neglected: the occurrence of non-unique respondents' answers across all questions in a given national survey. Although in some books and papers on survey quality "duplicate cases" are referred to as "errors," no assessment of the spread of these errors has been made in a systematic manner (2).

We assume that a record is erroneous, or suspicious, if it is not unique -- that is, when the set of all answers of a given respondent is identical to that of another respondent. The commonly used organization of survey data, with cases in rows and variables in columns, facilitates comparing the records of interviewees' responses. The number of rows equals the sample size and the number of columns is equal to the number of variables provided in a given survey. Thus the search for duplicate cases involves the comparison of all rows for those columns that the researcher takes into account.

Are non-unique records for respondents' answers undoubtedly suspicious? The answer to this query depends on the probability of at least two respondents providing the same answers to all questions. For a given number of questions, this probability is determined by the number of

response options, the dependence among answers to different questions and the number of respondents. In calculating the probability of duplicates, we consider these three factors referring to specific survey projects.

## Data and Results

We analyzed the collection of 1,721 national surveys in 22 projects from 142 countries covering 2.3 million respondents. Information about the selection of these projects is given in supplementary materials; the homepages of survey projects and links to source data files are provided in Tables S1 and S2. Table 1 lists 17 projects in which we found duplicate records.

\* Data were downloaded at the turn of 2013/2014. For details see Table S2.

<sup>†</sup> For Eurobarometer and International Social Survey Programme only selected survey editions were used.

**Abbreviations:** Asian Barometer (ABS), Afrobarometer (AFB), Americas Barometer (AMB), Asia Europe Survey (ASES), Caucasus Barometer (CB), Consolidation of Democracy in Central and Eastern Europe (CDCEE), Eurobarometer (EB), European Quality of Life Survey (EQLS), European Social Survey (ESS), European Values Study (EVS), International Social Justice Project (ISJP), International Social Survey Programme (ISSP), Latinobarometro (LB), Life in Transition Survey (LITS), New Baltic Barometer (NBB), Political Participation and Equality in Seven Nations (PPE7N), World Values Survey (WVS).

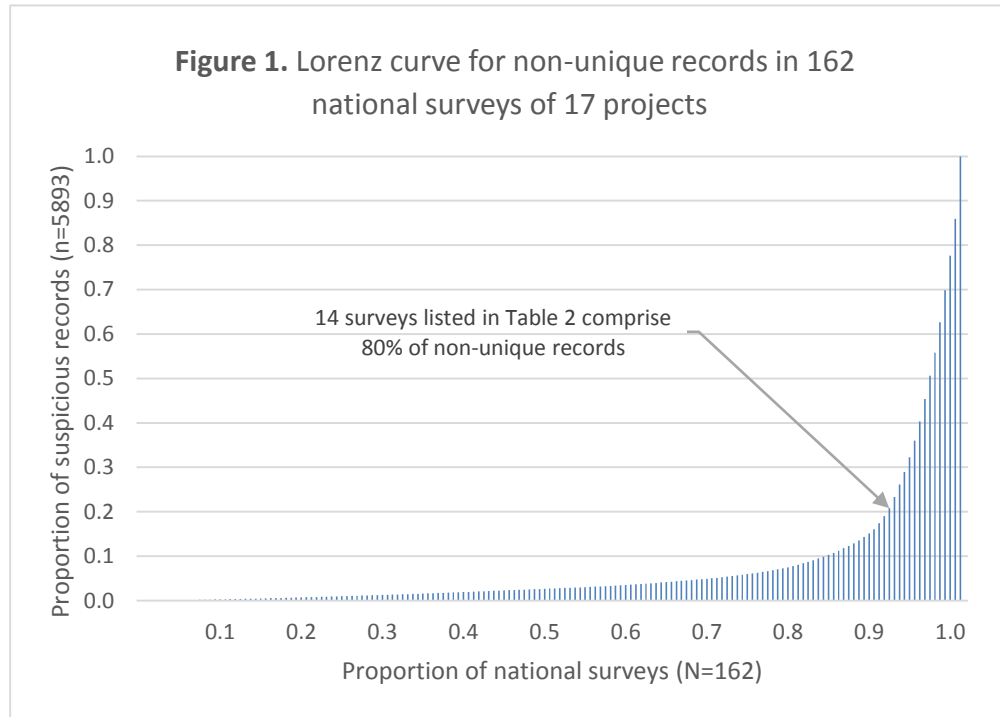

Survey questionnaires in these projects contain on average 228 questions addressed to respondents, with a range of 88 to 636 (3). To estimate the probability of duplicate records for such a number of questions, we assume dichotomous answers (binary choices) and the statistical independence of answers to 1/3 of the questions. The assumption about dichotomous answers provides the basis for a conservative estimate, since in practice respondents' answers are coded in multiple categories, which makes a duplicate record much less probable. The assumption of independence for a subset of questionnaire items is supported empirically: the usual pattern of statistically significant correlations of respondents' answers for a typical survey suggests that violations of postulated independence for 1/3 of items occur only rarely (4).

The uniqueness of records under the above assumptions is considered in terms of the classical birthday problem: how probable it is that among a given number of persons there will be a pair with the same birthday (5). The birthday problem is modified by replacing the number of days in a year by the number of possible sets of answers. In this model, an appropriate calculation shows that for 76 independent binary variables (1/3 of the average number of questions per national survey) one would need  $3.90 \cdot 10^{10}$  respondents in order to find a pair of identical sets of answers with the probability 0.01. For the 1/3 of the lower and upper bounds of the number of questionnaire items, the numbers of respondents needed for a duplicate are respectively 3,285 and  $1.15 \cdot 10^{31}$  (with the same probability 0.01). In other words, even for such a small number of cases as 3,285 we still need 100 samples of this size to expect a single duplicate. If duplicates occur in surveys with an average sample size (per survey project, see Table 1) ranging from 913 to 2,360 respondents and data administrators do not comment on their occurrence, such records are undoubtedly suspicious.

For all international survey projects listed in Table 1, we found 5,893 non-unique records (6). These records are concentrated in 162 surveys (9.4% of the total), unequally distributed. For example, they appear in 19.6% of surveys of the World Values Survey (the highest value) and 3.4% of surveys of the European Social Survey (the lowest value). Within each project, there are differences with respect to the number of countries in which surveys have non-unique records. In the extreme case, surveys in 13 out of 19 countries included in Latinobarometro contain non-unique records. The analogous numbers for the Americas Barometer are 10 in 24, and for the International Social Survey Programme 19 in 53; for other projects see Table 1. Overall, national surveys in 80 out of 142 countries have non-unique records. Thus, these results, with numbers defying the odds, show that suspicious records are common and universal.

We treat national surveys with non-unique records as imperfect since data administrators have not reported such records and relevant explanations are absent from data documentation. In 52% of the imperfect surveys a single duplicate record was found. Although a single duplicate in a survey has negligible consequences for statistical analysis, it may decrease confidence in the data. In the remaining 48% of imperfect surveys we found several patterns of non-unique records, such as multiple doublets or records repeated three, four, or even more times, often in combination. For example, in a survey conducted in Ecuador (Latinobarometro, 2000), 733 non-unique records (i.e. 272 doublets and 63 triplets) are present in the sample of 1,200, which means that over 60% of records are suspicious. In another survey in Norway (International Social Survey Programme, 2009) there are 54 records in 27 doublets, 36 in 12 triplets, 24 in 6 quadruplets, 25 in 5 quintuplets, 6 in 1 sextuplet, 7 in 1 septuplet, and 8 in 1 octuplet, with a total of 160 suspicious records in the sample of 1,456 (11.0%).

Distribution of non-unique records is provided in Figure 1.

The share of duplicate records is very uneven among national surveys: in 148 surveys there are 20% of all duplicated records and in 14 surveys there are 80% of all duplicated records. Commenting on the first group of surveys, we note that the proportion of duplicates in the respective sample usually does not exceed 1%. Are such rare occurrences troublesome for any statistical analyses? The answer to such a question depends on the kind of estimates the researchers are looking for. Even one forged duplicate record may significantly influence the results. For example, assume that the researcher is interested in finding out how many people live in the largest households in different countries. A forged duplicate record giving the misleading high maximum number may change the placement of this country among others with respect to the analyzed variable.

One duplicate record may change such a characteristic as the range of the distribution of the variable. However, what is particularly important for duplicate cases is a *pattern of values on all variables* taken into account in the analysis. A particular pattern of a single duplicated case may constitute a “deviant” case, influencing some taxonomic procedures in which respondents are clustered in multidimensional space.

In our view, even single duplicates should be subject to data quality control. Of course, a large number of duplicates in a particular survey is especially troublesome. Our analyses show that a large number of duplicates occur in the projects of Eurobarometer, European Values Study, World Values Surveys, International Social Survey Programme, Latinobarometro, and Consolidation of Democracy in Central and Eastern Europe. In 14 national surveys, included in these projects, there are more than 10% of non-unique records (see Table 2). Such a large number of non-unique records must influence the results of statistical analyses in which variances of variables are involved, thus

contaminating estimated regression models often used by researchers exploiting data from international survey projects. Analyses based on data including these imperfect surveys were published in influential books and prestigious journals.

**Table 2.** Fourteen National Surveys with the Largest Number of Non-unique Records

<b>Project/wave</b>	<b>Country</b>	<b>Number of cases</b>	<b>Number of non-unique records</b>	<b>Proportion of non-unique records</b>

## Discussion and conclusion

This study has implications for (a) already published work using international survey projects with duplicate records, (b) future research using these data sets, and (c) for survey methodology. Regarding the first, the estimated number of publications relying on data from analyzed projects differs depending on the source: based on information from the projects' web pages it is 11,000+, according to Google Scholar – 25,000+, and according to the Web of Science Core Collection – 2000+ publications and almost 20,000 citations (for details see Table S3 in supplementary materials). In the spirit of good science, authors may want to consider replication of their analyses with the goal of eliminating non-unique records or controlling for their presence (8).

To facilitate sound analyses in the future, we suggest that all institutions providing survey data check them for non-unique records and flag these records (i.e., create dedicated variables in data sets) but should not remove them from the data files. This suggestion is additionally motivated by the need for preserving original data in order to assess the effect of repeated records. It bears directly on the field of survey methodology.

Our next recommendation is that organizations conducting surveys check whether the data files contain repeated records and investigate possible sources of their occurrence. Theoretically, for any pair of identical records there are three possibilities: a) both records correspond to real respondents, b) one record corresponds to a real respondent and another one is its duplicate, and c) both records are fakes. The first possibility, as a miracle (9) or improbable coincidence (10), should be rejected on statistical grounds. For the two remaining possibilities, one could investigate whether the errors were caused by interviewers, data coders, or data processing staff. Recent

developments in the usage of paradata, the data about the process of generating survey data (11), provide tools for identifying the sources of non-unique records.

Our search for identical records in national surveys covers all questionnaire items that correspond to respondents' answers. In past research, investigation of duplicate records was limited to a subset of questionnaire items, with the claim that duplicates refer to "fake" cases (12, 13). The approach we propose is flexible with respect to the choice of variables in the investigated records, requiring that suspicious records be identified by a separate binary variable (suspicious = 1, otherwise = 0). Substantive analyses should take into account duplications as a kind of measurement error. Errors of this kind, shown to be voluminous in some national surveys administered by well-known international projects, need to be controlled for, since they reduce confidence in data and/or their effects potentially distort the results of substantive research.

## References and notes

## Supplementary Materials

Originally, we have chosen 22 international projects according to the following criteria: the projects are non-commercial; they were designed as cross-national, and – preferably – multi-wave; the samples were intended to represent the adult population of a given country or territory; questionnaires contain questions about political attitudes and behaviors; data are freely available; survey documentation (study description, codebook and/or questionnaire) is provided in English.

\* Data files were downloaded at the turn of 2013/2014. Whenever possible patches and corrections published through the end of March 2014 were applied.

<sup>1</sup> The data file was changed (without warning) sometime between the first and last access; we are using the later version.

<sup>2</sup> All nine files have an identical structure; we joined them into one integrated file.

<sup>3</sup> On first access another file was available:  
CB\_2009\_Final\_22.10.2010\_Regional\_Without\_NR.sav.

<sup>4</sup> On first access another file was available:  
CB\_2010\_regional\_weighted\_only\_responses\_03212011.sav.

<sup>5</sup> On first access another file was available: CB2011\_Regional\_Weighted\_12.07.12.sav.

<sup>6</sup> On first access another file was available: CB2012\_Regional\_Weighted\_01.03.2013.sav.

<sup>7</sup> 2014-01-21 a new version appeared with this time signature.

<sup>8</sup> In this file, wave 4 is in edition 4.1, wave 5 in edition 3.0.

<sup>9</sup> Wave 4 edition 4.2 published 2014-04-29; an auxiliary file for a patch.

<sup>10</sup> Wave 5 edition 3.1 published 2014-04-29; an auxiliary file for a patch.

<sup>11</sup> Wave 6 edition 1.2 published 2014-01-13.

<sup>12</sup> Wave 6 edition 2.0 published 2014-05-14; an auxiliary file for a patch.

<sup>13</sup> EVS data file has to be patched before merging with WVS.

<sup>14</sup> This may also be done before the merge.

<sup>15</sup> Merge syntax file; new link:  
[https://dbk.gesis.org/dbksearch/file.asp?file=ZA4804\\_MergeSyntax\\_EVS-WVS\\_v2-0-0\\_update.zip](https://dbk.gesis.org/dbksearch/file.asp?file=ZA4804_MergeSyntax_EVS-WVS_v2-0-0_update.zip).

\* Data gathered on 2015-02-06

# Data gathered on 2015-03-19. For the total number of items found on Google Scholar for a given project (provided in parentheses), we estimated the number of publications that refer to the project data in two steps: first, we decreased the total number of items proportionally to the number of relevant waves (e.g. for Eurobarometer we took 7 waves out of 80, i.e. 40,000 \* 0.0875); second, for large projects with the total number of items over 3000, we divide this number by 3; for the remaining projects we divide this number by 2.

† Data gathered on 2015-03-31

The following expressions have been used for searches: <sup>1</sup> "afrobarometer" OR "afro-barometer" OR "afro barometer" <sup>2</sup> "americas barometer" <sup>3</sup> "arab barometer" <sup>4</sup> "asian barometer survey" <sup>5</sup> "asia europe survey" <sup>6</sup> "caucasus barometer" <sup>7</sup> "consolidation of democracy in central and eastern europe" <sup>8</sup> "comparative national elections project" OR "comparative national election project" <sup>9</sup> "eurobarometer" <sup>10</sup> "european quality of life survey" <sup>11</sup> "european social survey" <sup>12</sup> "european values study" OR "european value study" OR "european values survey" OR "european value survey" <sup>13</sup> "international social justice project" <sup>14</sup> "international social survey programme" OR "international social survey program" <sup>15</sup> "latinobarometro" OR "latino barometro" OR "latino barometer" OR "latinobarometer" <sup>16</sup> "life in transition survey" <sup>17</sup> "new baltic barometer" <sup>18</sup> "political action ii" <sup>19</sup> "political action" "eight nation study" <sup>20</sup> "political participation and equality" "verba" <sup>21</sup> "values and political change in post communist europe" <sup>22</sup> "world values survey" OR "world value survey" OR "world values study" OR "world value study"

\* Country codes according to the list provided by the International Organization for Standardization ([http://www.iso.org/iso/country\\_codes.htm](http://www.iso.org/iso/country_codes.htm))

<sup>1</sup> ID 10080 occurs twice in the data set, but the other case is not a duplicate of the mentioned pair. <sup>2</sup> All mentioned values of variable v2 for ISSP 1998, Bulgaria are non-unique and indicate both suspicious cases. <sup>3</sup> There is no original variable assigning respondent/case ID; we use an SPSS system variable \$CASENUM instead.
